1.0 System Overview

1.1 System Name

QUEWIE – Queue Management and Monitoring System

1.2 System Description

The QUEWIE Queue Management and Monitoring System is an integrated information system developed for the City Government of General Santos – Office of the Building Official (OBO).

It automates the queueing process in service-oriented offices by generating digital tickets, assigning clients to service counters, and displaying real-time updates on public monitors.

The system consists of two main components: a web-based administration panel and a self-service kiosk application.

The kiosk, powered by Sunmi K2 smart terminals, allows citizens to select a service and print their queue ticket, while the web application enables staff and administrators to manage counters, call clients, and monitor transactions efficiently.

Both modules operate within the same Local Area Network (LAN) environment, ensuring reliable, real-time synchronization even without an internet connection.

1.3 System Purpose

The main purpose of the QUEWIE System is to streamline and digitalize the queue management process in public offices.

It provides an automated, transparent, and efficient way of serving clients, helping reduce waiting times and improve the overall quality of government service delivery.

1.4 System Objectives

The system aims to:

- Provide a self-service kiosk where citizens can easily obtain queue tickets.
- Automate the handling and calling of clients across multiple service counters.
- Display real-time queue information through public monitors.
- Reduce service congestion and manual errors caused by traditional queueing.
- Improve transparency and accountability in public service transactions.
- Support OBO's ongoing digital transformation initiatives through smart office technologies.

1.5 System Features

The QUEWIE System includes the following key features:

- **Self-Service Kiosk Module** – Citizens can select a service and print a queue ticket using the Sunmi K2 terminal.
- **Queue Management Dashboard** – Allows staff to call, hold, or skip queues in real time.
- **Public Monitor Display** – Shows current serving numbers and counters for public viewing.
- **Service Management** – Enables administrators to add, update, or remove service categories.

- **Counter Configuration** – Assigns staff to specific counters based on branch or service.
- **LAN Connectivity** – Synchronizes kiosks, monitors, and dashboards within the same local network.
- **Automatic Queue Reset** – Resets queue data daily according to a configured schedule.
- **Transaction Logging** – Records all served, held, or skipped queues for reporting and audit purposes.
- **Offline Operation** – Continues functioning even without an internet connection.

1.6 System Users

- **Citizens / Clients** – Obtain queue tickets from the self-service kiosk.
- **Staff / Tellers** – Manage and serve clients through the Queue Dashboard.
- **Administrators** - Configure services, counters, monitors, and user access.

1.7 System Scope

The QUEWIE System covers the following:

- Digital queue-ticket generation through kiosks.
- Real-time client calling and management by staff.
- Monitor display synchronization within the local network.
- Administrative tools for configuration, reports, and counter setup.

The system focuses on in-office queue control and local synchronization between kiosks, monitors, and administrative panels.

It does not include mobile queueing or remote booking functions, but it supports future integration for online synchronization if required.

1.8 System Platform

- Platform Type: Hybrid System (Web Application and Kiosk Interface)
- Technology Stack: PHP (Laravel Framework), MySQL Database, Tailwind CSS, JavaScript, and Reverb WebSockets for real-time updates
- Kiosk Platform: Flutter (Dart) using GetX State Management and Sunmi K2 Printer SDK
- Deployment Environment: Local Server and LAN-connected Sunmi Terminals
- Connectivity: Operates offline through local IP communication between kiosks, monitors, and web modules
- Device Support: Desktop Computers, Laptops, Public Monitors, and Sunmi K2 Smart Terminals

2.0 System Credentials

2.1 Default Account

The QUEWIE Queue Management and Monitoring System provides predefined user accounts for administrators and staff during the initial deployment phase. These accounts are used to access the web-based application interface. It is strongly recommended that administrators change the default passwords after setup to maintain security

Email	Password
<u>admin@kiosqueueing.local</u>	password
<u>staff@kiosqueueing.local</u>	password

The administrator account grants full system control, allowing configuration of users, counters, services, and monitors. The staff account, on the other hand, is used by front-line personnel or tellers to manage queue operations and assist citizens at their designated counters.

2.2 Server Account

The QUEWIE System is hosted on an Ubuntu-based Local Server, which serves as the main platform responsible for managing backend operations, local database storage, and real-time communication across the kiosk, web, and monitor interfaces.

Administrators can access this server for maintenance or troubleshooting purposes using the following credentials:

Server	Username	Password
Ubuntu Server	queuing	Password

To access the server, the administrator must log in directly to the Ubuntu terminal or remotely through a Secure Shell (SSH) connection within the local network. This provides administrative access to perform configuration updates, restart services, or review system logs.

For example, when connected to the same network, the administrator can log in using the following command

Example: How to access the server using cmd.

Figure 1: Access Server Using CMD

After entering the password, the system will grant access to the Ubuntu server shell environment.

Note:

Administrators may directly access the Ubuntu server using the provided credentials when performing maintenance or troubleshooting. Only authorized personnel are permitted to access the server for security purposes.

Figure 2: Login to Server Directly Example.

3.0 Login Access

The QUEWIE Queue Management and Monitoring System is accessed through a web browser within the institution's Local Area Network (LAN).

All users must log in using their assigned credentials to access their respective modules and perform authorized operations.

The system ensures secure authentication and role-based redirection, allowing users to access only the modules relevant to their assigned responsibilities.

Steps:

1. On a computer connected to the local network, open a web browser (e.g., Google Chrome or Microsoft Edge). Type the following address in the browser's address bar:
2. <http://172.16.128.57/login>
3. Press **Enter** to load the system's login page.
4. Enter your assigned **Email Address** and **Password** in the login form.
5. Click the **Login** button to proceed.
6. Wait for the system to validate your credentials against the local database.
 - If valid, you will be redirected to your assigned dashboard or counter interface.
 - If invalid, an error message will appear prompting you to re-enter correct information.

3.1 User Roles and Access Permissions

- **Administrator Login** – Grants full access to all system modules, including configuration of users, services, counters, and monitor.
Administrators may also generate reports, manage queues, and monitor live operations.
- **Staff Login** – Intended for front-line personnel assigned to service counters.
After logging in, the system automatically redirects the staff user to the **Counter Selection Screen** if no counter has been assigned.
Once a counter is selected, the staff interface loads, allowing queue actions such as Call, Hold, Skip, Cancel, or Complete.

Note:

Before logging in, ensure that the workstation is connected to the same Local Area Network (LAN) as the Ubuntu Server. If the login page does not load, verify that the server is powered on and reachable within the network. All passwords are case-sensitive, so users should double-check spelling and capitalization when entering credentials. For security reasons, users must not share their login details with others. All login activities are automatically recorded by the system for accountability and audit purposes.

4.0 Dashboard Overview

After successfully logging into the QUEWIE System, users are redirected to the Dashboard page (see **Figure 4**). The Dashboard serves as the central control panel for administrators, providing a quick summary of the system's overall activity and access to all management modules.

The Dashboard displays key system statistics such as the total number of services, monitors, users, and counters currently configured. These visual indicators help administrators verify that all components of the system are active and functioning properly.

Located on the left panel is the Navigation Menu, which provides access to all major system modules:

- **Users** – Manage system accounts and assign user roles or permissions.
- **Services** – Define and configure the types of services available for clients.
- **Counters** – Set up and assign counters for staff use.
- **Monitors** – Configure display screens that show real-time queue information.
- **Queues** – Review and manage current, pending, or completed transactions.
- **Settings Management** – Adjust queue reset times, announcements, and other configuration options.

4.1 Role-Based Redirection

Upon login, the system automatically redirects users to their respective pages based on their assigned role:

- **Administrator** – Redirected to the Dashboard, with full access to all modules and configuration tools.
- **Staff / Teller** – Redirected to the Counter Selection Screen, where they can choose their assigned counter before serving clients.

Figure 4. Admin Dashboard Page

5.0 User Management

The User Management module allows administrators to add, edit, or remove system accounts. It ensures that only authorized users can access the system and that each role has appropriate permissions.

5.1 Steps to Create a New User

Steps:

1. From the Dashboard, go to **Users → Create User**.
2. Fill in the following fields:
 - **Full Name** – Enter the user's complete name.
 - **Email Address** – Input a valid email to be used for login.
 - **Role** – Select Administrator or Staff based on the assigned responsibility.
 - **Password** – Set the user's initial password.
3. Review the entered details for accuracy.
4. Click **Save or Submit** to finalize user creation.
5. The newly added account will now appear in the **User List**.

The screenshot shows a 'Create New User' modal window. At the top, it says 'Create New User' with a close button (X) on the right. Below this is a subtitle: 'Add a new user to the system. Users can be assigned to branches and given different roles.' The form is divided into three main sections: 'User Information', 'Access Details', and 'Password'. The 'User Information' section has two input fields: 'Full Name' (with a red asterisk) and 'Email Address' (with a red asterisk). The 'Access Details' section has a 'Role' dropdown menu (with a red asterisk). The 'Password' section has two input fields: 'Password' (with a red asterisk) and 'Confirm Password' (with a red asterisk). At the bottom left, there are two buttons: 'Submit' (blue) and 'Cancel' (white). The form is set against a dark gray background.

Figure 6. Users List

Note:

Each user must have a unique email address and a secure password. Only administrators are allowed to modify or deactivate existing user accounts. It is recommended that inactive accounts be reviewed and removed regularly to maintain system security

6.0 Service Management

The Service Management module defines all services available for kiosks, counters, and monitors. Each service represents a specific office process, such as Building Permit Application or Business Processing.

Steps to Create a Service:

1. From the Dashboard, go to Services → Create Service.
2. Fill in the required details:
 - Service Name – The title or name of the service.
 - Service Code – A short identifier (e.g., BLDG01).
 - Service Description – A short explanation of the transaction type.
3. Click Submit to save the new service.

The screenshot shows the 'Service Management' page in the QUEWIE system. It features a sidebar with navigation options: Dashboard, Users, Services (selected), Counters, Monitors, Queues, Transaction Histories, and Setting Management. The main content area displays a table of services with columns for Name, Code, Description, and Created. Each row includes 'Edit' and 'Delete' buttons. A search bar is located at the top right of the table. The table lists 14 services, all created on Oct 13, 2025.

Name	Code	Description	Created

Figure 7. Services List

The screenshot shows the 'Create New Service' modal form. It includes a title bar with a close button, a subtitle 'Add a new service to the system. Services are used to group queues and define the order of processing.', and a 'Service Information' section. The form has three input fields: 'Service Name' (required), 'Service Code' (required), and 'Service Description'. At the bottom are 'Submit' and 'Cancel' buttons.

Figure 9. Edit Service

Note:

Services are directly linked to both counters and monitors. Only the services assigned to a counter appear in the staff interface, while kiosks use the same list to generate queue tickets. Administrators are encouraged to review the list of services periodically to ensure that all configurations remain accurate and up to date.

7.0 Counter Management

The Counter Management module represents physical desks where staff handle clients.

Each counter is configured with specific services it can process and can be enabled or disabled as needed

Steps to Create a Counter:

1. From the Dashboard, go to Counters → Create Counter.
2. Fill in the following details:
 - **Counter Name** – Example: Counter 1 or Cashier Desk.
 - **Allowed Services** – Choose which services this counter can handle.
 - **Status** – Set to Active or Inactive.
3. Click **Create to Confirm**.

Note:

Counters are automatically linked to staff accounts during login. Only active counters appear in the selection list, and assigning the correct services ensures that clients are directed to the appropriate staff members for each transaction.

8.0 Monitor Management

Monitor Management module configures display screens showing real-time queue progress. Each monitor displays ticket numbers, service names, and counters being served. It also includes an automated voice announcement feature that calls the next ticket number.

Steps to Create a Monitor:

1. From the Dashboard, go to Monitors → Create Monitor.
2. Fill in the following fields:
 - Monitor Name – Example: Main Lobby Display.
 - Location – Specify the monitor's physical area.
 - Description – Optional notes about purpose or use.
 - Assigned Services – Choose which queues this monitor will display.
3. Click **Create** or **Save Changes**

Note:

Monitors automatically update queue information in real time through the local network. The system's voice call-out feature announces the next ticket number whenever staff initiate a call. For easier identification and maintenance, it is recommended to use descriptive monitor names based on their physical location.

9.0 Queue Management

The Queue Management module displays all active tickets generated by kiosks.

It allows administrators to monitor queue progress, staff activity, and ticket status in real time.

Statuses:

- **Waiting** – Ticket has been issued but not yet called.
- **Called** – Ticket has been announced and awaiting service.
- **Serving** – Transaction in progress.
- **Completed** – Service completed successfully.
- **Skipped / Cancelled** – Ticket manually handled by staff.

Note:

Queue data is automatically synchronized across all kiosks, monitors, and counters in real time. All queue logs are stored in the Transaction History module for audit and reporting purposes.

Figure 14. Queue List

10.0 Transaction History

The Transaction History module logs all queue-related activities, including calls, holds, skips, and completions. It allows administrators to review daily operations and export data for recordkeeping.

Steps to Export Transactions:

1. From the Dashboard, go to Transaction Histories.
2. Click Download CSV.
3. The downloaded file will include:
 - Ticket Number
 - Service Name
 - Counter
 - Staff Name
 - Time and Action Type

Note:

Exported transaction data can be opened using Microsoft Excel or Google Sheets. It is recommended that administrators perform regular exports for documentation, monitoring, and performance reporting.

11.0 Settings Management

The Settings Management module lets administrators configure ticket numbering, branch reset schedules, and system parameters.

It ensures consistent queue numbering and prevents duplicate tickets during daily operations.

Steps to Reset Queue Counts:

1. From the Dashboard, go to Settings → Branch Settings.
2. Click Reset Branch Queues.
3. Confirm the action to start a new count for the day.

Options

- **Ticket Prefix** – Example: QUE → QUE-001.
- **Starting Number** – Defines where ticket counting begins.
- **Queue Reset Time** – Default automatic reset: 4:00 AM.

Note:

Queue resets should only be done at the start of a new workday or after testing. This action permanently deletes all current day queue entries. Always export Transaction History before performing a reset.

12.0 Staff Interface

12.1 Selecting Counter

After logging in, staff users must select a counter before starting any transaction.

Each counter represents a specific service desk or workstation configured by the administrator.

This step ensures that all actions performed by the staff are properly linked to the correct counter and service category.

Figure 18. – Counter Selection Screen showing available counters

Steps:

1. After logging in, the Counter Selection Page will automatically appear.
2. Review the list of available counters. Each counter displays its assigned services.
3. Select the counter you are assigned to operate.
4. Click Confirm to activate the counter.
5. The system will automatically redirect you to the Counter Page, where you can begin serving clients.

Figure 19. – Confirmation Dialog for Counter Selection

Note:

Only active counters appear in the selection list. Each counter is configured with specific services defined by the administrator, and staff must verify the assigned counter name before confirming. Once a counter is selected, the system automatically loads the queue list for that counter.

12.2 Serving Clients

The Serving Clients feature allows staff to manage client tickets assigned to their selected counter. This interface enables staff to call, serve, hold, skip, or cancel tickets in an orderly and trackable manner. All updates are synchronized with the kiosk, monitor, and transaction logs in real time.

Figure 20. – Active Counter Interface showing queue list and control buttons.

Steps:

1. Open the Counter Page after confirming your assigned counter.
2. Review the Next Ticket panel to view the current queue for your services.
3. Select a ticket from the list. The available action buttons will then activate.
4. Click **Call Number** to announce the selected ticket.
 - The ticket number will appear on the monitor and be announced through the audio system.
5. Once the client arrives, click Serve to begin processing the transaction.
6. When the service is complete, click Complete to finalize the ticket.
 - The record will automatically be logged in the Transaction History.
7. If necessary, use the following additional options:
 - **Hold** – Pause the ticket for later resumption. It will appear in the Resume Hold panel.
 - **Skip** – Move to the next client if the current one is unavailable.
 - **Cancel** – Mark the ticket as invalid or cancelled.
8. To resume a held ticket, go to the Resume Hold panel, select the ticket, and click Resume to continue the transaction.

Hold Ticket

Hold Reason (optional)

Cancel Confirm Hold

W SERVING

12:35 PM

Figure 21. – Resume Hold Panel View

Note:

Each ticket action—Call, Serve, Hold, Skip, Cancel, or Complete—automatically updates the monitor display and triggers a voice announcement. Staff must ensure that the monitor’s speakers are functioning properly before calling clients. The system does not automatically move to the next ticket; staff must manually select and process each transaction. All actions are time-stamped and recorded in the Transaction History for accountability and performance review.

13.0 Monitor Setup & Display

The Monitor Setup & Display feature allows administrators or staff to configure and display real-time queue information in public areas such as lobbies or waiting halls.

Monitors show the current ticket being served, the assigned counter, and the corresponding service type.

They also provide an audio announcement whenever a counter calls a new ticket, ensuring clients are properly guided to their assigned service desks.

Steps:

1. On a device connected to the same network, open a web browser and type the following URL:
2. <http://172.16.128.57/monitors>
3. Enter the assigned Branch Code (e.g., HQ01) and click Find Monitors.
4. Select the desired Monitor from the available list.
5. Click View Display to launch the full-screen queue view.
6. If the screen appears blank, verify that services are properly assigned to that monitor.

Note:

Each monitor is linked to one or more services configured in the Monitor Management module. Monitors automatically announce ticket numbers through the audio system when a counter staff calls the next client. For better visibility, it is recommended to display the monitor in full-screen mode. All monitor devices must remain connected to the same Local Area Network (LAN) as the server to maintain real-time updates throughout the day.

14.0 Notes & Troubleshooting

This section provides solutions to common issues and best practices for maintaining the Quewie Queue Management and Monitoring System.

14.1 Common Issues and Solutions

Common Issues and Solutions: A blank monitor screen indicates that no services are assigned to the monitor; this can be fixed by checking its configuration under Monitor Management. If no queues appear, ensure that at least one counter is active and serving clients. When queues do not reset daily, verify that the reset time in Settings Management is correctly configured. If no audio announcement plays, confirm that the monitor's speakers are unmuted and properly connected.

14.2 Tips and Best Practices

Tips and Best Practices: Always run monitors in full-screen mode to improve readability in public areas. Ensure that all kiosks, counters, and monitors remain connected to the same LAN network to maintain synchronization. Export transaction logs regularly for documentation and audit purposes. Restart the local server weekly to maintain stable performance, and review assigned services periodically to ensure accuracy.
